Abnormal Grain Growth – from N.M. Hwang

Scope

Fundamentals

1. Concept of Surface Energy
2. A Rough Estimation of Solid Surface Energy
3. Anisotropy of Surface Energy
4. Curvature Effect
 - Capillary Pressure
 - Vapor Pressure
 - Solubility
 - Melting Point
5. Measurement of Surface/Interface Energy

Interface Phenomena

1. Adsorption
2. Segregation
3. Crystal Shape
4. Grain Growth

Concept of Surface Energy and Surface Tension

$$dG = -SdT + VdP + \gamma dA$$

$$\gamma = \left(\frac{\partial G}{\partial A} \right)_{T,P}$$

$$2l\gamma dx = Fdx$$

$$\gamma = \frac{F}{2l}$$

Stretching a film—increasing area.

Rough Estimation of Solid Surface Energy

Pair approximation

$$\Delta H_s = 0.5ZN_A\varepsilon$$

Necessary Work for Creation
of (111) surface in fcc (/atom)

$$w = \frac{3}{2}\varepsilon = \frac{\Delta H_s}{4N_A} \quad \gamma = \frac{\Delta H_s}{4N_A} \left(\frac{N}{A} \right)$$

For fcc (111): $N/A = 4/(3^{1/2}a^2)$

fcc (100): $N/A = 2/a^2$

For Cu: $a = 3.615 \text{ \AA}$ $\Delta H_s = 337.7 \text{ J/mol}$

$\gamma_{(111)} = 2460 \text{ erg/cm}^2$ (1700 by expt.)

For fcc

$$\frac{\gamma_{(100)}}{\gamma_{(111)}} = \frac{2}{\sqrt{3}} = 1.15$$
